AB A device for emitting repellent odor
or attractant scent comprising a closed
container having odoriferous composition therein
and being formed from thin sheet material which is
pervious therethrough to gaseous effluent from the composition and
is impervious to passage therethrough of liquid.

AB The novel seedling bud capping **device** is easily deployed on a bud of a seedling due to the use of adherent on either edge (rather than a staple), and more particularly due to its predefinedly selective use of adherent to form an inverted conic space around the bud for receiving sunlight and for capturing the bud stem near its base. The paper stock or the adherent used in the bud capping **device** may be impregnated with a **repellent scent** to further ward away browsers to protect the seedling. Preferably, the bud capping **device** is made from a small, e.g. 5 inch, square piece of water-repellent paper stock having a layer of glue adjacent at least one edge. The stock is protected on the adherent side by another layer of material to be selectively removed. This protective layer is scored and a free segment of the protective backing layer is removed to expose a region of adherent. Because the adherent is wider at the base than at the top, when the device is deployed near a terminus of a seedling bud, it grasps the base of the bud's stem at a fulcrum of an inverted cone while leaving open the top of the **device** for exposure to sunlight. The bud capping **device** prevents browsing of a fragile seedling while permitting the seedling to thrive. The bud capping **device** may be affixed with a pull-tab **scent device** of any suitable configuration, preferably with a slow-release animal **repellent**. The **device** may be arranged and mass-produced in laminar **sheets**, cut and formed into rolls for easy dispensing.

AB **Attraction** of Phyllophaga elenans to vaned bucket traps baited with the recently identified female-produced **pheromone**, L-isoleucine Me ester (LIME), is efficient. Pheromone-baited vaned buckets with water to retain insects were more effective than buckets without vanes or **plastic containers** with the sides cut out. Pheromone-baited vaned bucket traps from which water was omitted required the addition of a funnel below the vanes to retain insects. Normally used light traps were about 10 times more effective than pheromone-baited vane bucket traps in capturing P. elenans. Over 95% of P. elenans were captured between 6:00 and 9:00 PM. The male-female ratio was .apprx.3-4:1 in both light and pheromone traps, and the ratio was relatively unchanged throughout the capture period. Most P. elenans were

09/842963

captured in the treed areas surrounding sugarcane fields. More *P. elenans* were captured in treed borders than in grassy borders of sugarcane fields. The effective radius of the pheromone-baited vanned bucket trap is between 5 and 15 m.

LANGUAGE: English

AB A simple approach that gave a range of conducting polymer coated screen-printed carbon track sensors on flexible polyester substrate was developed. The most effective method involved pretreating the sensor surface with a chemical deposited poly(pyrrole) chloride layer followed by subsequent electrodeposition of the desired PPY film. The anal. performance in terms of sensitivity and selectivity is similar to sensors produced using microlithog. to form gold tracks on silicon substrates. The low cost and ease of fabrication make these sensors an attractive alternative to existing devices for use in odor identifications and discrimination.

PRIORITY APPLN. INFO.: US 1999-404647 19990924

AB A **scent**-handling device for attracting wild game includes a plug that snugly fits into either end of a receptacle to selectively place the **scent**-handling device in a sealed mode for tightly containing a **scent** inside the receptacle and a wide-open aerating mode for releasing the **scent**. The device includes several well thought out features that allow it to be inexpensively manufactured by way of a straightforward **plastic** injection molding process. A resilient clip extending sideways from the receptacle allows the clip and the receptacle to be injection molded together as a unitary piece without having to resort to a complicated mold having expensive side-action pulls. The clip includes several teeth that allow both the receptacle and the plug to be firmly fixed to various size branches or other items, thereby avoiding the problem of startling skittish animals with something dangling from the branch, or dangling while in transport. The plug includes an O-ring seal to create a piston/cylinder affect as the plug is inserted into the receptacle. Consequently, air forcibly escaping from the receptacle as the plug is being inserted produces a reassuring sound indicative of a tightly sealed closure.

CODEN: EAACEM; ISSN: 0168-8162
PUBLISHER: Chapman & Hall
DOCUMENT TYPE: Journal
LANGUAGE: English

AB A large-scale field test using pheromone-acaricide-impregnated
plastic tail-tag decoys demonstrated excellent efficacy of
these **devices** for control of the bont tick on cattle in
Zimbabwe. The tail tags were impregnated with a mixture containing
o-nitrophenol, Me salicylate, 2,6-dichlorophenol and
phenylacetaldehyde and 1 of 3 different acaricides (cyfluthrin,
flumethrin or alpha-cypermethrin). O-Nitrophenol and Me salicylate
are components of the A. hebraeum **attraction**
-aggregation-attachment **pheromone**, while
2,6-dichlorophenol and phenylacetaldehyde are proven
attractants for this tick. Both o-nitrophenol and Me
salicylate were lost gradually from the tags over 12 and 14 wk
periods, resp. In field trials, tick counts were compared between
cattle that received tail tags either impregnated with pheromone
mixture alone, cyfluthrin and pheromone mixture, flumethrin and
pheromone mixture, alpha-cypermethrin and pheromone mixture or were left
untreated. During the 1st 3 mo trial period, control of adult bont
ticks was 94.9% with cyfluthrin tail tags and 87.5% with flumethrin
tail tags. In general, there was no significant difference in bont
tick nos. on cattle without tags and those with tail tags containing
pheromone only. When the trial was repeated for another 3 mo
period, control of bont ticks with tail tags containing cyfluthrin and
flumethrin was 99.3 and 95.1%, resp. However, control of bont ticks
using alpha-cypermethrin was only 79.2%. Overall, retention of tail
tags was excellent although some loss was encountered during the
rainy season. In addition to controlling bont ticks, the tail tags
provided moderate control of other tick species (Rhipicephalus
evertsi evertsi, Rhipicephalus zambeziensis and Hyalomma spp.)
simultaneously infesting cattle in the trials.

AB Insect-repelling devices consist of communication-confusing agents comprising $\geq 90/10$ weight ratio of Z/E mixts. or Z-isomers of **pheromones**. The agents are effective for Lepidoptera. (Z)-11-Hexadecenal 25, ethylene-vinyl acetate copolymer 75, catechol 0.5, and CH₂Cl₂ 450 weight parts were mixed, coated on polyethylene terephthalate **film**, dried, and cut into tapes. The tapes exhibited 91% repellency against Caloptilia theivora in a tea field.

AB The title **films**, with good appearance and properties, are prepared by extruding granulated **plastics** intensively mixed with perfumes. Adding five 30-g portions of vanillin at 10-min intervals to 50 kg low-d. polyethylene and pigments in a granulator-mixer at room temperature and extruding at 185-190° gave a **film** which was welded to give a packaging **pouch** with an **attractive odor** which was not adulterated by the **plastic** and persisted unchanged for several months.

AB The present invention discloses containers for storing fishing lures, baited or unbaited hooks, terminal tackle, fishing accessories, bait, fishing lines and other fishing devices ("target objects"). The containers are designed for quick and efficient insertion of the target objects into the containers. Fasteners attached to such containers, in addition to closing the opening of the containers, allow for quick attachment and detachment of the containers to and from a fishing rod, thereby capturing and retaining line and thus minimizing entanglement. These fastening devices may also be used to attach the containers to other non-rod objects such as boats or clothing for immediate access to or storage of target objects. All versions of containers

09/842963

may be formed of at least partially clear plastic or other materials for ready identification of the contained materials.

AB A fishing lure storage and display apparatus
is provided which features transparent storage receptacles
releasably suspended from a hanging rod allowing the lures
to be easily viewed and readily accessed. The storage receptacles
retain the lure in isolation from the outer environment
thus sustaining the shape, color and scent of the
lure and protecting it from crushing damage or
entanglement. The receptacles can take on a variety of forms such
as a flexible polypropylene pouch or a tubular member
constructed from a semi-rigid plastic.

AB Improved heaters and self-heating packages that function without
application of external energy. Heat is generated by contact of a
heat-producing composition, such as calcium oxide, and an
activating solution which is typically water. The heater contains
multi-compartment containing heat-producing composition and
activating solution. The heater is activated by application of
hand pressure to rupture a frangible seal which allows the heater

09/842963

components to mix. The heater compartments are at least in part formed from flexible walls. The self-heating package has one or more products or product containers in thermal contact with one or more heaters. In preferred packaging embodiments, the heating package has one or more product containers or pouches in thermal contact with one or more heaters. In a specific embodiment, the product container is integrally formed with the heater. Preferred self-heating packages are constructed entirely of flexible packaging materials.

AB A barrier film composition can comprise a thermoplastic web comprising a thermoplastic polymer and a dispersed cyclodextrin composition having substituents that compatibilize the cyclodextrin in the film. The thermoplastic/cyclodextrin film obtains substantial barrier properties from the interaction between the substituted cyclodextrin in the film material with a permeant. The substituents on the cyclodextrin molecule causes the cyclodextrin to be dispersible and stable in the film material resulting in an extrudable thermoplastic. Such materials can be used as a single layer film material, a multilayer film material which can be coated or uncoated and can be used in structural

materials wherein the thermoplastic is of substantial thickness resulting in structural stiffness. The cooperation between the cyclodextrin and the thermoplastic polymer provides barrier properties to a web wherein a permeant can be complexed or entrapped by the cyclodextrin compound and held within the film preventing the permeant from passing through the film into the interior of a film, an enclosure or container. The permeant can comprise a variety of well known materials such as moisture, aliphatic or aromatic hydrocarbons, monomer materials, off flavors, toxic compounds etc.

AB A molded porous polyvinyl alcohol sponge includes an outer skin capable of absorbing and passing water to interior portions of the sponge, and is substantially smooth except for predetermined structural details imparted by the mold used in its making. The outer skin has smaller average pore size than does the interior portion of the product.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A barrier film composition can comprise a thermoplastic web comprising a thermoplastic polymer and a dispersed cyclodextrin composition having substituents that compatibilize the cyclodextrin in the film. The thermoplastic/cyclodextrin film obtains substantial barrier properties from the interaction between the substituted cyclodextrin in the film material with a permeant. The substituents on the cyclodextrin molecule causes the cyclodextrin to be dispersible and stable in the film material resulting in an extrudable thermoplastic. Such materials can be used as a single layer film material, a multilayer film material which can be coated or uncoated and can be used in structural materials wherein the thermoplastic is of substantial thickness

resulting in structural stiffness. The cooperation between the cyclodextrin and the thermoplastic polymer provides barrier properties to a web wherein a permeant can be complexed or entrapped by the cyclodextrin compound and held within the film preventing the permeant from passing through the film into the interior of a film, an enclosure or container. The permeant can comprise a variety of well known materials such as moisture, aliphatic or aromatic hydrocarbons, monomer materials, off flavors, toxic compounds etc.

LINE COUNT:	179	

AB An organoleptically active substance **container** for producing a deodorant, scenting and/or **repellent** effect comprises an **envelope** made of water-impermeable, gas-permeable synthetic resin in which a mixture of an organoleptically active substance in powder form, typically a deodorant, **perfume** or **repellent**, and a powdery water-absorbing synthetic resin is contained either as such or packed in a water-soluble **film**, the **envelope** being equipped, at one corner thereof, with a tightly closable water inlet for introducing water into the **envelope**.

With the above container, a simple procedure comprising only introducing water into the water-impermeable, gas-permeable synthetic resin envelope makes it possible to secure the desired deodorant, scenting and/or repellent effect, among others, for a prolonged period of time. Since the powdery water-absorbing synthetic resin powder-active substance powder mixture is placed, either as such or in the form of a pack, in the envelope, the container as a whole is not bulky but lightweight before use, hence can be stored in transported with ease.

AB A bait package for wildlife comprises an odoriferous, effusive attractant material in an absorbent material therefor sealed within an easily puncturable container, which is placed at a desired location and punctured for use. For capturing marine life, such as edible crustaceans, e.g. crayfish, the attractant material may be a fish oil and the absorbent material either a usual bait formulation or an inexpensive, inedible, insoluble material, such as sawdust, and the bait package may be encased by an open weave material that catches the claws of the crustaceans. The bait package may also be covered with a porous material, such as a plastic foam sheeting, to protect the container and to aid diffision of the attractant following puncture of the container. The open weave material encasing the bait package is preferably a reusable case of special formation.

AB A soil or other ground cover is treated for termite or other pest control by dispersing in the soil or on the ground, a toxic insecticide in an active available state and a toxic insecticide in an initially unavailable state and timed to be released before complete dissipation of the immediately available insecticide. The initially unavailable insecticide is enveloped in a container made of a material either in whole, in part attractive to and edible by the pest to release the insecticide when the container or plug is eaten by the pest. Combined with the insecticide is any odoriferous material which will signal the presence of termites by its distinctive odor. A soil coloring agent can be used also or in addition to provide a visual signal. The odor producing agent can be used alone.

AB Disclosed herein is a cartridge for controllably dispensing a liquid substance, which cartridge includes a sealed envelope or package comprising first and second plies of a plastic material which is permeable to the liquid substance, each of the plies formed to include a plurality of parallel corrugations with the corrugations of one of the plies being substantially identical to the corrugations of the other of the plies. The first and second plies are also peripherally sealed to each other in opposed relation to form the sealed package or envelope with the corrugations of one of the opposed plies in nested relation to the corrugations of the other of the opposed plies. In addition, the sealed package or envelope includes a quantity of the liquid substance and has portions overlaid with respect to each other and separated from each other by intervening spacer means.

NOVELTY - The device has a closed container (10) having odoriferous composition (22), and formed from flexible thin sheet material (12) which is pervious to the passage of gaseous effluent from the composition and is impervious to passage of liquid.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

09/842963

(a) an animal attraction/repulsion method; and a blister pack dispensing device for animal attractant and repellent.

USE - For emitting **repellent odor** or **attractant scent** for luring or **repulsing** animals e.g. deer, rodent.

ADVANTAGE - Provides a tight fit arrangement which limits the space inside surface of the envelope and the outside surface of the container, thus odoriferous effluent is retained in the composition until the outer envelope is removed.

DESCRIPTION OF DRAWING(S) - The figure shows the isometric view of the container which is a component of the emitting device.

Closed container 10

Flexible thin sheet material 12

Odoriferous composition 22
